## ARCHAEOLOGY & HISTORIC PRESERVATION

### ▶ LIDAR SCANNING

Lidar (Light Detection and Ranging) scanning technology is a remote sensing method that uses laser light to measure distances and create detailed, three-dimensional representations of surfaces. This allows historic architects and preservationists to generate incredibly detailed blueprints of historic buildings that often provide a more accurate documentation of the building and its condition than traditional methods.

Utah's community of preservationists invite you to explore Utah's history by participating in fun educational events all across the state. Throughout the month of May you will have the opportunity to learn first hand from experts by participating in hikes, walking tours, and presentations. Everyone is welcome and we hope to see you there. Scan the QR code to discover something old!
