

UTAH

ARCHAEOLOGY & HISTORIC PRESERVATION

► PHOTOGRAMMETRY

Photogrammetry creates textured, three-dimensional models from a series of photographs. By analyzing the geometry and relationships within a set of overlapping photographs, photogrammetry software can reconstruct the spatial characteristics of objects or landscapes. Archaeologists use photogrammetry to display artifacts and places that are difficult or impossible to access, making it a valuable tool for preservation and education.

Utah's community of preservationists invite you to explore Utah's history by participating in fun educational events all across the state. Throughout the month of May you will have the opportunity to learn from experts by participating in hikes, walking tours, and presentations. Everyone is welcome and we hope to see you there.
